- Portfolio: https://www.dremdem.ru
- Languages: Russian (native), English (B2, daily work with English-speaking teams since 2018)
- Location: Thailand (GMT+7), fully remote, any time zone (EU or US hours overlap)
- Contract: independent contractor; invoicing or EOR

Professional Summary

Python backend engineer with 8+ years on remote product teams (Flask, Django, FastAPI), after 15 years of enterprise ERP consulting (Oracle E-Business Suite) for mining, energy and logistics companies. I build APIs, data pipelines (Airflow, pandas) and integrations with third-party systems, and keep the delivery side healthy: Docker images, CI on GitHub Actions, dependency upgrades. I am comfortable on the business side too: requirements, specifications, user training.

Technical Skills

Languages: Python, SQL, PL/SQL, Bash; TypeScript and JavaScript (working knowledge)

Backend: Flask, Django, Django REST Framework, FastAPI, SQLAlchemy, GraphQL, REST APIs, OpenAPI, Pydantic

Data & ETL: pandas, NumPy, PyArrow, Airflow, Dash, data validation, Jupyter-to-production

Databases & search: MySQL, PostgreSQL, MS SQL Server, MongoDB, Oracle, Elasticsearch (basic)

Cloud & infrastructure: AWS (ECS Fargate, Lambda, S3, ECR), Google Cloud (GKE), Docker, Docker Compose, multi-stage images, Kubernetes (basic), Terraform

Queues: Celery, Redis (light)

Build, test & CI/CD: GitHub Actions, pytest, Poetry, uv, dependency management, container registries (GHCR, Docker Hub, ECR)

Frontend: React, Next.js (working knowledge, AI-assisted)

Tools: Git, GitHub, Jira, Linux

Professional Experience

Senior Python Developer | **Causify**

December 2022 - **Present** | Remote

Causify (formerly ParticleOne; I rejoined after working there in 2020–2021) builds a causal-AI platform for predictive analytics on market data. I worked on the data, application and infrastructure side, supporting the quant team.

- Built a dependency-update pipeline for Docker images across 4–5 repositories, including a monorepo with several images: GitHub Actions rebuilds the multi-stage images with pinned Python dependencies (Poetry, later uv), runs the full test suite against them, and opens a PR with the updated `pyproject.toml` for an admin to approve; approved images are pushed to GitHub Container Registry, Docker Hub and AWS ECR. This turned rare, painful upgrades (dependency conflicts, behaviour changes in pandas, NumPy, PyArrow) into a routine semi-automated release
- Maintained and optimized Airflow DAGs that collect and clean data from crypto exchanges, stock markets and commodity prices and launch the quant team's compute jobs
- Turned research Jupyter notebooks into production Dash applications that stakeholders could use without running code
- Built a modular platform on top of these apps (React, TypeScript, Next.js, largely AI-assisted): each app became a module that could be enabled per customer, so customers could assemble their own application, with a subscription model in view
- Ran services on AWS (Fargate, Lambda, S3) in Docker, with CI on GitHub Actions and pytest

Technologies: Python, Flask, FastAPI, Dash, Airflow, pandas, NumPy, PyArrow, pytest, Poetry, uv, Docker, GitHub Actions, AWS (Fargate, Lambda, S3, ECR), React, TypeScript, Next.js

Python Backend Developer | SXOPE

May 2022 - December 2022 | Remote

SXOPE is a healthcare platform automating physicians' daily workflows.

- Developed Django APIs for the platform's medical document flows (prescriptions, insurance documents)
- Implemented search on Elasticsearch: indexed the data, wrote queries and fixed slow ones
- Worked with the MySQL schema behind these features
- Managed workloads on Google Kubernetes Engine (deploying and restarting pods) and added Terraform for the GCP access permissions the services needed

Technologies: Python, Django, MySQL, Elasticsearch, Docker, Kubernetes (GKE), Google Cloud, Terraform

Python Backend Developer | Zentist

August 2021 - May 2022 | Remote

Zentist automates insurance revenue cycle management for dental practices.

- Developed GraphQL APIs on Flask for the insurance claims and billing workflows
- Wrote and optimized MySQL queries and designed database models for billing data
- Covered my features with unit and integration tests (pytest)
- Deployed services to Kubernetes in Docker

Technologies: Python, Flask, GraphQL, MySQL, pytest, Docker, Kubernetes

Python Developer | ParticleOne

September 2020 - August 2021 | Remote

ParticleOne (renamed Causify later) provides machine-learning analytics on financial market data.

- Wrote the Python client library for the company's REST API: it started as my one-week hiring

assignment, and I kept extending it after joining
- Built ETL loaders and data validation for exchange data: currency rates and crypto prices
- Wrote Airflow DAGs to schedule the loading and processing jobs
- Refactored the data science team's model training pipelines
- Worked with MongoDB and Docker-based services

Technologies: Python, pandas, Airflow, MongoDB, Docker, REST

Freelance Python Developer | Upwork

2017 - 2020 | Remote, short contracts alongside ERP consulting

- AutoCruitment: REST API for matching patients with clinical trials (Django, OpenAPI, PostgreSQL, MongoDB)
- Plantix (PEAT GmbH, Berlin): Flask API for a crop-disease diagnosis mobile app, serving ML model predictions
- Orbeliani: Django backend, initiative workflows and sponsor payments for a crowdfunding platform
- JELT: rebuilt a scraper-backed web application, backend and frontend (Flask, MongoDB)

Earlier career: Enterprise ERP Consultant (Oracle E-Business Suite)

15 years | IBM Global Business Services, BDO Unicon and other consultancies

- Implemented Oracle EBS modules (Enterprise Asset Management, Purchasing, Sourcing, Order Management, Inventory) and Oracle Utilities CC&B for a large mining company (Kazakhstan), a national postal operator and energy retailers
- Gathered requirements and wrote functional and technical specifications (Oracle AIM / OUM)
- Wrote PL/SQL procedures, reports and ETL scripts to migrate and clean data at go-live
- Trained key users and end users

Projects & Open Source

Personal projects:

- Job Radar - local-first job search assistant: collects vacancies from a dozen sources, scores them with explained rules and adds an LLM analysis (Claude) whose quotes are checked against the vacancy text; FastAPI, HTMX, SQLite, 740+ tests, CodeQL and OpenSSF Scorecard in CI
- django-oebs-eam - Django tool that reads Oracle EBS Enterprise Asset Management tables and visualizes how maintenance models are built, which Oracle's own screens show poorly; used in my consulting work and shared with colleagues
- Stupid Chat Bot | GitHub - AI-powered Telegram chatbot with a web interface
- CV Profile | GitHub - personal site deployed by a CI/CD pipeline (GitHub Actions, Docker, VPS)

Open source:

- pytest-monitor-backend - Flask and MongoDB backend for pytest-monitor
- tldr-pages - Russian translations, merged upstream

Take-home assignments:

- FastAPI microservice with Celery - asynchronous XML processing
- Site monitoring over Kafka - website health checker with a message broker
- Serverless Kanban board backend - AWS Lambda API

Certification: Oracle E-Business Suite Purchasing (earlier career)
